

DROP AWAY ARROW REST SYSTEM

ABSTRACT OF THE DISCLOSURE

A housing has a hollow interior with coupling components for releasably coupling the housing to a bow. A shaft has an interior segment and an exterior segment. The interior segment is rotatably supported within the housing. A generally Y-shaped launcher has a downwardly extending arm and two laterally spaced upwardly extending arms. The downwardly extending arm has an aperture receiving the exterior segment of the shaft for the rotation of the launcher. A thumbwheel is mounted on the interior component of the shaft for rotation by the user to rotate the shaft and launcher to an intermediate orientation. A cord has a first end. The first end is secured to the thumbwheel for rotating the thumbwheel. A second end is coupled to the string. Pulling the string will rotate the shaft and launcher to an essentially vertical orientation.
